with a modified polylinker; Plasmid DNA from the
normalized library NCI_CGAP_Pr22 was prepared, and ss
circles were made in vitro. Following HAP purification,
this DNA was used as tracer in a subtractive hybridization
reaction. The driver was PCR-amplified cDNAs from a pool
of 5,000 clones made from the same library (cloneIDs
985608-986759, 1101192-1101959, and 1217928-12206I5).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      tissue was pooled from 10 individuals ranging in age from 4-80 years and RNA was extracted. From this pooled sample an aliquot of 60ug of total RNA yielded 2.17ug of mRNA. A directionally cloned cDNA library in the pCMVSPORT6 vector was constructed at Life Technologies, essentially following the protocols of the SuperScript Plasmid System full details of which are contained in the manufacturer's instruction manual (http://www.lifetech.com/). First strand synthesis was carried out using a Not I primer-adapter [5'-pGACTAGTTCTAGATCGCAGCGGCCCC(T)15-3']. Not I/blunt end inserts were cloned into the Not I/EcoR V sites in the vector. EST analysis was performed on the unamplified library at the NIH Intramural Sequencing

                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence encodes the full-length cell surface receptor ACT-4 isolated from activated CD4+ T-lymphocytes. The sequence may be expressed in e.g. COS-7 cells. The encoded protein, its ligands if fragments, and antibodies may be used for the treatment of transpirejection, graft-versus-host disease, autoimmune disease, etc.

The sbp and its fragments are useful in pharmaceutical compositions to modify a patient's immune response as well as having application in the treatment of transplant rejection, graft versus host disease, autoimmune disease, inflammation, infectious agents, HTLV infected cells or HIV. Specifically the sbd can be used to treat inflammatory bowel disease. The sbd can also be used for screening for immunomodulatory agents able to recognise ACT-4 and for monitoring activated CD4 positive cells or inhibiting infection of CD4 positive cells.

Antigen OX-40 is specifically expressed on the cell surface of antigen activated T-cells, especially, for example, CD4+ T-cells. A human cDNA encoding the human OX-40 homologue was cloned as follows. Using the Experimental Autoimmune Encephalomyelitis model in rats the OX-40 antigen was identified (expressed on the surface of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               activated autoantigen-specific CD4+ T-cells present at the site of inflammation but absent on CD4+ T-cells at non-inflammatory sites) and CDNA encoding the antigen was isolated. PCR primers were designed and used to clone murine OX-40 cDNA by PCR from RNA isolated from murine CD4+ T-cells activated with concanavalin A. Then the murine OX-40 cDNA was used to probe a cDNA lambda gtll library from human activated T lymphocytes to obtain human OX-40 cDNA. The published patent application states that the OX-40 cDNA sequence is also in SQ ID no. 1, but this sequence is not present in the spec. A nucleic acid having the sequence in SQ ID no 1 and the polypeptide encoded by it are claimed.
                                                                                                                                                                                                                                                                                                                                       Oligonucleotide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           secondary signalling sequences. The specification describes stimulatory primary signalling motifs. Primary motifs are efficient at at mediating immune cell signal transduction, particularly when incorporated in an intracellular signalling domain of a chimeric receptor. The primary signalling motif can be combined in any way so as to achieve the desired level of activation (or inhibition) of a number of secondary messenger cascades. The signalling motifs are useful in therapy and in the manufacture of medicament for treating or preventing disease in humans or animals. They are are useful for treating lumman patients suffering from infectious diseases e.g. human lummondeficiency virus (HIV) infections, inflammatory/autoimmune diseases such as asthma and eczema, congenital diseases e.g. cystic fibrosis, sickle cell anemia, dermatological diseases e.g. sporiasis, neurological diseases e.g. multiple sclerosis, transplant-related disease e.g. organ

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                sclerosis), organ transplant rejection of sclerosis), organ transplant rejection of sclerosis), organ transplant rejection of cancer). The metabolic/idiopathic diseases (e.g. diabetes or cancer). The present sequence is one of a large number of oligonucleotides used in the construction of sequence blocks (SBs) of primary and secondary signalling motifs. Primary signalling motifs are sequences that transduce either a stimulatory or an inhibitory signal, which regulates primary activation of the T cell receptor (TCR) complex. Secondary motifs impart secondary or co-stimulatory signalling capacity to a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           these primary signalling motifs are useful in medicine and research. They are useful in therapy, or in the manufacture of a medicament for treating or preventing disease in humans or in animals. These diseases include infections (e.g. HIV (human immunodeficiency virus) infection), inflammatory or autoimmune diseases (e.g. asthma or eczema), congenital diseases (e.g. systic fibrosis or sickle cell anaemia), dermatological diseases (e.g. psoriasis), neurological diseases (e.g. multiple sclerosis), organ transplant rejection or graft-versus host disease, or matabolic disease, or disbette or cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New nucleic acids encoding polypeptides with expanded primary signaling motifs, for use in gene therapy, particularly for treating or preventing infections, inflammations or autoimmune diseases in humans
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        a consensus amino acid sequence. These motifs are extremely efficient at mediating immune cell signal transduction, particularly when incorporated into an intracellular signalling domain of a chime receptor. Nucleic acids that encode, and polypeptides that contain,

CC receptor protein comprising an extracellular ligand-binding domain, a ctransmembrane domain and an intracellular signalling domain. The contracellular signalling domain and cintracellular signalling domain. The cintracellular signalling domain comprises the cytoplasmic portion of at least one adaptor protein, and the extracellular ligand-binding domain comprises the cytoplasmic portion of at cleast one adaptor protein, and the extracellular ligand-binding domain comprises the cytoplasmic portion of at least one adaptor protein, and the manufacture of a medicament for the creatment or receptor protein and the nucleic acid encoding it are useful in therapy. They are useful in the manufacture of a medicament for the creatment or prevention of diseases in humans and animals. They are useful in the treatment of infectious diseases (e.g. HIV infection), compenital diseases (e.g. cystic fibrosis and sickle cell anaemia), compenital diseases (e.g. cystic fibrosis and sickle cell anaemia), compenital diseases (e.g. psoriasis), neurological diseases (e.g. transplant rejection, graft-versus-host compenital diseases (e.g. psoriasis), neurological diseases (e.g. transplant rejection, graft-versus-host compens sequence is one of a large number of oligonucleotides used in the construction of sequence blocks (SBs) of primary and secondary signalling motifs transduce either a stimulatory or on inhibitory signal, which regulates primary activation of the T cell receptor (TCR) complex. Secondary signalling motifs impart cemponents of the adaptor receptor protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel polynucleotide encoding adaptor receptor protein useful for treating human immunodeficiency virus (HIV) infection, asthma, cy fibrosis, multiple sclerosis, organ transplant rejection, diabete
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Example 3;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       01-NOV-1999;

The primary signalling motif can be combined in any way so as to achieve the desired level of activation (or inhibition) of a number of secondary messenger cascades. The signalling motifs are useful in therapy and in the manufacture of medicament for treating or preventing disease in humans or animals. They are are useful for treating human patients suffering from infectious diseases e.g. human immunodeficiency virus (HIV) infections, inflammatory/autoimmune diseases such as another adverse the secondary of the seases of contents of the seases of contents of the seases of contents of the seases and contents of the seases and contents of the seases are contents.

when incorporated into an intracellular signalling domain of a chimeric receptor. Nucleic acids that encode, and polypeptides that contain, these primary signalling motifs are useful in medicine and research. They are useful in therapy, or in the manufacture of a medicament for ctreating or preventing disease in humans or in animals. These diseases include infections (e.g. HIV (human immunodeficiency virus) infection), contifiammatory or autoimmune diseases (e.g. asthma or eczema), congenital diseases (e.g. psoriasis), neurological diseases (e.g. psoriasis), neurological diseases (e.g. multiple ctreation), organ transplant rejection or graft-versus-host disease, or metabolic/diopathic diseases (e.g. diabetes or cancer). The present sequence is one of a large number of oligonucleotides used in the construction of sequence blocks (SBs) of primary and secondary csignalling motifs. Primary signalling motifs are sequences that ctransduce either a stimulatory or an inhibitory signal, which regulates or motifs impart secondary or co-stimulatory signalling capacity to a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New nucleic acids encoding polypeptides with expanded primary signaling motifs, for use in gene therapy, particularly for treating or preventing infections, inflammations or autoimmune diseases in humans
                                                                                                                                                                                                                                                                                                                                                         The invention relates to novel primary signalling motifs containing a consensus amino acid sequence. These motifs are extremely efficient at mediating immune cell signal transduction, particularly

                                                                                                                                     QY
                                                                                                                                                                  Matches
                                                                                                                                                                                                                                                  inflammatory and autoimmune diseases (e.g. asthma and eczema), depending the diseases (e.g. cystic fibrosis and sickle cell anaemia), dermatological diseases (e.g. psoriasis), neurological diseases (e.g.) multiple sclerosis), organ transplant rejection, graft-versus-host disease and metabolic/idiopathic diseases such as diabetes and cancer. The present sequence is one of a large number of oligonucleotides used in the construction of sequence blocks (SBs) of primary and secondary signalling motifs transduce either a stimulatory or an inhibitory signal, which regulates primary activation of the T cell receptor (TCR) complex. Secondary signalling motifs may be used as components of the adaptor receptor protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     WPI;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               antisickling; antipsoriatic; neuroprotective; immunosuppressive; antidiabetic; cytostatic; HIV infection; inflammation; autoimmune disease; cystic fibrosis; sickle cell anaemia; psoria neurological disease; organ transplant rejection; diabetes; canc
                                                                                                                                                                                                                                                                                                                                                                                                                     is not CD8 or a major histocompatibility complex (MHC) class I protein. The adaptor receptor protein and the nucleic acid encoding it are useful in therapy. They are useful in the manufacture of a medicament for the treatment or prevention of disease in humans and animals. They are useful in the treatment of infectious diseases (e.g. HIV infection),
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a novel nucleic acid encoding an adaptor receptor protein comprising an extracellular ligand-binding domain, a transmembrane domain and an intracellular signalling domain. The intracellular signalling domain comprises the cytoplasmic portion of at least one adaptor protein, and the extracellular ligand-binding domain

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence represents the mouse OX40 extracellular domain encoding cDNA. The extracellular domain of OX40 is its ligand binding domain. The present cDNA was used in the construction of the chimeric OX40/Fc cDNA (AAV32640). The invention claims for a murine OX40-L cytokine (AAW48975) that binds to the OX40 murine T cell antigen. The OX40-L protein is claimed to be useful for co-stimulation of T-cell production and in binding assays for detecting OX40 or its homologues. The OX40-L protein is also claimed to generate a TH-2

The fusion protein was used for detecting cDNA clones encoding an OX40 ligand. The invention claims for a murine OX40-L cytokine (AAW4897 that binds to the murine T cell antigen, OX40. The OX40-L protein is claimed to be useful for co-stimulation of T-cell production and in binding assays for detecting OX40 or its homologues. The OX40-L protein is also claimed to generate a TH-2 immune response.

      The invention relates to a nucleic acid comprising a sequence of 18 bases, of a segment of chemically pretreated DNA (CP DNA) e.g. with bisulphite, of genes associated with tumour suppression and oncogenes having a sequence taken from 536 (actually 533 since numbers 408, 458 and 500 are missing from the sequence listing) sequen (Ss) and sequences complementary to (Ss). The nucleic acid may be a peptide nucleic acid-oligomer (PNA) of at least 9 nucleotides and may form part of a set of probes for detecting the cytosine methylation st and/or single nucleotide polymorphisms and also to be used in an array for analysing diseases associated with Cpc dinucleotides e.g. cancers and tumours. The probes can also be used in a method for
                                                                                                                                                                                                                                                                                                                                      06-APR-2000;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Antigen OX-40 is specifically expressed on the cell surface of antigen activated T-cells, especially, for example, CD4+ T-cells. A human cDNA encoding the human OX-40 homologue was cloned using primers 1 and 2. Template DNA for PCR amplification to product the human OX-40 cDNA can be extracted from the lambda GT11 cDNA library from human activated T-lymphocytes produced by Clontech, Palo Alto, California (Catalog No. HL10316).

The present invention describes differentially expressed general in anglogenesis (I), and the polypeptides that encode them. cardiovascular activity, and can be used in the modulation of anglogenesis. The nucleic acids and polypeptides may be used prevention, diagnosis and treatment of diseases associated with the presentation of the presentati

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       antagonists may also be used to down regulate expression and activity
and modulate angiogenesis. The antibodies may also be used as diagnostic
agents for detecting the presence of the polypeptides in samples.

Disorders that may be prevented, diagnosed and/or treated by the above methods include, for example vascular tunours, proliferative tumours, attended to the state of the sample vascular timours, proliferative tumours, proliferative tumours, proliferative tumours, attended to the state of the sample vasculation, provided arthritis, Crohn's disease, and associated with neovascularisation, restenosis subsequent to balloon angioplasty, scar tissue over production, peripheral vascular disease, typertension, inflammatory vasculatides, Reynaud's disease and Reynaud's phenomenon, aneurysms, arterial restenosis, thrombophlebitis, lymphangitis, lymphedema, wound healing and tissue repair, ischaemia creperfusion injury, angina, myocardial infarctions, chronic heart failure such as congestive heart failure, age-related macular degeneration and osteoporosis. antiarteriosclerotic and cytostatic. The secreted proteins and their polynucleotides can be used in gene therapy and as vaccines, chemotaxis-modulators and anglogenesis-modulators. The human secreted proteins and polynucleotides can be used for diagnosing (the susceptibility to) a pathological condition by determining the presence or absence of a mutation in the polynucleotide or determining the presence or amount of expression of the protein. The polynucleotides and proteins can also be used in the treatment and diagnosis of cancer,
                                                       diseases of the immune system, hyperproliferative disorders, cardiovascular disorders and neurological disease. They can also be used to promote wound healing and to fight infection. AAA87657 to AAA87665 at AAB25664 represent sequences used in the exemplification of the present

                                                                                                                                                                                                                                                                                                                                                                                              cc which represent the human OFFX open reading frames I to 3161. The OFFX CS sequences have activities such as: cytostatic; hepatotropic; vulnerary; cc antiporiatic; anticonvulsant; antiarthritic; immunosuppressant; cc immunostimulant; cardiant; thrombolytic; coagulant; vasotropic; cc antidiabetic; hypotensive; dermatological; immunosuppressant; cc antidiabetic; hypotensive; dermatological; immunosuppressive; cc antitinflammatory; antibacterial; antiviral; antifungal; antirheumatic; cc antithyroid; and antianaemic. The sequences can be used for determining ct the presence of or predisposition to, or preventing or treating ct the presence of or predisposition to, or preventing or treating creative acids can be used to express OFFX proteins in gene therapy cectors. The proteins and nucleic acids may be used to treat cancers, cc proliferative disorders, neurodegenerative disorders, osteoarthritis, creative hypertension, hypothyroidism, cholesterol ester storage, systemic lupus crythematosus, severe combined immunodeficiency (SCID), AIDS, viral, callergies, aplastic anaemia, burns, wounds, boacturnal haemoglobhnuria, antiinflammatory disease; to enhance coagulation; to inhibit thrombosis; and as a contraceptive.
                                                                                                                                                                                                                                                                                                         Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopolesis regulating activity, tissue growth factor activity, immunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Tang

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention provides human phosphatases (PP) and polynucleotides encoding the phosphatases. The polypeptides can be expressed by standard recombinant methodology. The PP are useful for treating a disease or condition associated with decreased expression of functional phosphatases. Compositions containing agonists or antagonists of PP may be used to treat a disease associated with decreased expression or overexpression of PP, respectively. Such diseases may include Alzheimer's disease, Huntington's disease, immune disorders, and cancers. The present sequence represents a human phosphatase encoding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1089
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel phosphatases useful for treating diseases associated with decreased expression of functional phosphatases, e.g., Alzheime disease, Huntington's disease, immune disorders, and cancers -

                                                                                                                                                        The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity tissue growth factor activity, immunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to novel genes (AAL34669-AAL37666) and proteins CC (ABB03087-ABB04109) associated with the musculoskeletal system useful CC for preventing, treating or ameliorating medical conditions e.g. by CC protein or gene therapy. The genes are isolated from a range of human CC tissues disclosed in the specification. The nucleic acids, proteins, cCC antibodies and (ant)agonists are useful in the diagnosis, treatment CC and prevention of: (a) cancer, e.g. breast and ovarian cancer and CC other cancers of the adrenal gland, bone, bone marrow, breast, CC gastrointestinal tract, liver, lung, or urogenital; (b) immune CC disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, CC multiple sclerosis, rheumatoid arthritis and ulcerative colitis; CC colitis cardiovascular disorders such as myocardial ischaemias; (d) wound constitute in the colorious diseases e.g. cerebral anoxia and epilepsy; candiditic infectious diseases such as viral, bacterial, fungal and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I) amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic activity, and can be used in gene therapy and vaccine production. (I) proteins and polynucleotides may be used in the prevention, diagnosis an treatment of diseases associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of (I) by expressing inactive proteins or to supplement the patients own production of (I). Additionally, (I)
                                                                                                                                                                                              Disclosure;

(I) proteins and polynucleotides may be used to prevent, diagnose and treat immune/haematopoletic-related diseases, especially cancers and cancer metastases of haematopoletic-derived cells. AAK64703 to AAK87694 represent human immune/haematopoletic antigen genomic sequences from the present invention. AAK874942 to AAK84950 and AAM82169 represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                          16-MAR-2000;

                                                                                                                                                                   CC AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I) CC amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic c activity, and can be used in gene therapy and vaccine production. (I) CC proteins and polynucleotides may be used in the prevention, diagnosis and ctreatment of diseases associated with inappropriate (I) expression. For CC example, they may be used to treat disorders associated with decreased CC expression by rectifying mutations or deletions in a patient's genome CC that affect the activity of (I) by expressing inactive proteins or to CC supplement the patients own production of (I). Additionally, (I) CC polynucleotides may be used to produce the secreted (I), by inserting CC the nucleic acids into a host cell and culturing the cell to express the protein. (I) proteins and polynucleotides may be used to prevent. (CC diagnose and treat immune/haematopoietic-derived cells. AAK64703 CC cancers and cancer metastases of haematopoietic antigen genomic CC concers and cancer metastases of haematopoietic antigen genomic CC cancers from the present invention. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL116176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I) amino acid sequences given in AAM82170 to AAM91921. (I) have cycostatic activity, and can be used in gene therapy and vaccine production. (I) proteins and polynucleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               that affect the activity of (I) by expressing inactive proteins or to supplement the patients own production of (I). Additionally, (I) polynucleotides may be used to produce the secreted (I), by inserting the nucleic acids into a host cell and culturing the cell to express protein. (I) proteins and polynucleotides may be used to prevent, diagnose and treat immune/haematopoletic-related diseases, especially

CC inappropriate angiogenesis. The polypeptides may also be used as antigens cC in the production of antibodies against them and in assays to identify comodulators of their expression and activity. The antibodies and cci nate of their expression and activity. The antibodies and cci nate of their expression and activity comodulate angiogenesis. The antibodies may also be used as diagnostic companies for detecting the presence of the polypeptides in samples. CC Disorders that may be prevented, diagnosed and/or treated by the above companies of the polypeptides in samples. CC proliferative vitreoretinopathy, rheumatoid arthritis, Crohn's disease, cc atherosclerosis, overlan hyperstimulation, psoriasis, endometricals associated with neovascularisation, restences subsequent to balloon companies of the polypeptides in samples. CC appertusion, inflammatory vasculatides, Repnaud's disease and cc phyphangitis, lymphedema, wound healing and tissue repair, ischaemia cc reperfusion injury, angina, myocardial infarctions, chronic heart cc conditions, heart failure such as congestive heart failure, age-related cc macular degeneration and osteoporosis. AAH22255 to AAH22325 and AAB98322 cropresent invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes differentially expressed genes involved in angiogenesis (I), and the polypeptides that encode them (I) have cardiovascular activity, and can be used in the modulation of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                angiogenesis. The nucleic acids and polypeptides may be used in prevention, diagnosis and treatment of diseases associated with
                                                     present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          polypeptides may be used

              The present invention provides the protein and coding sequences of a number of human digestive system antigens. These can be used in the diagnosis, treatment and prevention of digestive system disorders, including cancer, Meckel's diverticulum, bacterial or parasitic infections, appendicitis, Hirschsprung's disease, chronic colitis or ulcerative colitis. The present sequence is a cDNA encoding a digest
                                                                                                                                   Claim
                                                                                                                                                                 Polynucleotides encoding digestive system antigens, useful for diagnosing, treating, preventing and/or prognozing disorders digestive system, particularly cancer and cancer metastases.
                                                                                                                                                                                                                                      WPI; 20

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   seq length: 0 seq length: 2000000000
